## Cumulative Distribution Functions

## A special case: the exponential distribution

## Continuous random variables

- Two types of random variables:
- Discrete random variable: one that can only take on

Introduction to
Continuous
Random Variables
Probability Density Functions

Cumulative

- Continuous random variable: one that can fall in an interval of real numbers ( $T$ and $Z$ ).
- Examples of continuous random variables:
- $Z=$ the amount of torque required to loosen the next bolt (not rounded).
- $T=$ the time you'll have to wait for the next bus home.
- $C=$ outdoor temperature at 3:17 PM tomorrow.
- $L=$ length of the next manufactured part.

## Continuous random variables

- $V: \%$ yield of the next run of a chemical process.
- $Y$ : \% yield of a better process.
- How do we mathematically distinguish between $V$ and

Introduction to
Continuous
Random Variables
Probability Density

- We want to show that $Y$ tends to take on higher \% yield values than $V$.

## $V$ and $Y$ have continuous probability distributions

## Definition: probability density function (pdf)

- A probability density function (pdf) of a continuous random variable $X$ is a function $f(x)$ with:

Introduction to
Continuous
Random Variables
Probability Density
Functions

$$
\begin{aligned}
& f(x) \geq 0 \text { for all } x . \\
& \int_{-\infty}^{\infty} f(x) d x=1 \\
& P(a \leq X \leq b)=\int_{a}^{b} f(x) d x, a \leq b
\end{aligned}
$$

- The pdf is the continuous analogue of a discrete random variable's probability mass function.

## Example

- Let $Y$ be the time delay (s) between a 60 Hz AC circuit and the movement of a motor on a different circuit.
- Say $Y$ has a density of the form:

$$
f(y)= \begin{cases}c & 0<y<\frac{1}{60} \\ 0 & \text { otherwise }\end{cases}
$$

Introduction to
Continuous
Random Variables
Probability Density
Functions
Cumulative
Distribution
Functions
we say that $Y$ has a Uniform( $0,1 / 60$ ) distribution.

- $f(y)$ must integrate to 1 :

$$
1=\int_{-\infty}^{\infty} f(y) d y=\int_{-\infty}^{0} 0 d y+\int_{0}^{1 / 60} c d y+\int_{1 / 60}^{\infty} 0 d y=\frac{c}{60}
$$

- hence, $c=60$, and:

$$
f(y)= \begin{cases}60 & 0<y<\frac{1}{60} \\ 0 & \text { otherwise }\end{cases}
$$

Continuous
Random Variables
Probability Density
Functions

In fact, for any random variable $X$ and any real number a:

$$
\begin{aligned}
P(X=a) & =P(a \leq X \leq a) \\
& =\int_{a}^{a} f(x) d x=0
\end{aligned}
$$

## Outline

Continuous Random Variables (Ch. 5.2)

## Will Landau

Introduction to
Continuous

## Introduction to Continuous Random Variables

Random Variables
Probability Density Functions

## Probability Density Functions

## Cumulative Distribution Functions

## A special case: the exponential distribution

## Cumulative distribution functions (cdf)

- The cumulative distribution function of a random variable $X$ is a function $F$ such that:

$$
F(x)=P(X \leq x)=\int_{-\infty}^{x} f(t) d t
$$

In other words:

$$
\frac{d}{d x} F(x)=f(x)
$$

- As with discrete random variables, $F$ has the following properties:
- $F(x) \geq 0$ for all $x$.
- $F$ is monotonically increasing.
- $\lim _{x \rightarrow-\infty} F(x)=0$
- $\lim _{x \rightarrow \infty} F(x)=1$

## Example: calculating the cdf of $Y$

- Remember:

$$
f_{Y}(y)= \begin{cases}60 & 0<y<1 / 60 \\ 0 & \text { otherwise }\end{cases}
$$

Introduction to
Continuous
Random Variables

- For $y \leq 0$ :

$$
F(y)=P(Y \leq y)=\int_{-\infty}^{y} f(t) d t=\int_{-\infty}^{0} 0 d t=0
$$

- For $0<y<1 / 60$ :

$$
F(y)=P(Y \leq y)=\int_{-\infty}^{y} f(t) d t=\int_{-\infty}^{0} 0 d t+\int_{0}^{y} 60 d t=60 y
$$

- For $y \geq 1 / 60$ :

$$
\begin{aligned}
F(y) & =P(Y \leq y)=\int_{-\infty}^{y} f(t) d t \\
& =\int_{-\infty}^{0} 0 d t+\int_{0}^{1 / 60} 60 d t+\int_{1 / 60}^{\infty} 0 d t=1
\end{aligned}
$$

## A look at the cdf

## Your turn: calculate the following using the cdf

Introduction to
Continuous
Random Variables

$$
F(y)= \begin{cases}0 & y \leq 0 \\ 60 y & 0<y \leq \frac{1}{60} \\ 1 & y>\frac{1}{60}\end{cases}
$$

Probability Density
Functions

Cumulative
Distribution
Functions
A special case: the exponential

1. $F(1 / 70)$
2. $P\left(Y \leq \frac{1}{80}\right)$
3. $P\left(Y>\frac{1}{150}\right)$
4. $P\left(\frac{1}{130} \leq Y \leq \frac{1}{120}\right)$

## Answers: calculate the following using the cdf

1. $F\left(\frac{1}{70}\right)=60 \frac{1}{70}=\frac{6}{7}$
2. $P\left(Y \leq \frac{1}{80}\right)=F\left(\frac{1}{80}\right)=60 \frac{1}{80}=\frac{3}{4}$
3. 

$$
\begin{aligned}
P\left(Y>\frac{1}{150}\right) & =\int_{1 / 150}^{\infty} f(y) d y \\
& =\int_{-\infty}^{\infty} f(y) d y-\int_{-\infty}^{1 / 150} f(y) d y \\
& =1-F(1 / 150)=1-\frac{60}{150} \\
& =\frac{3}{5}
\end{aligned}
$$

Introduction to

Random Variables
Probability Density
Functions
Cumulative
Distribution
Functions
A special case: the exponential
distribution

In fact, for any random variable $X$, discrete or continuous:

$$
P(X \geq x)=1-P(X<x)
$$

4. 

## Introduction to

Continuous

$$
\begin{aligned}
P\left(\frac{1}{130} \leq Y \leq \frac{1}{120}\right) & =\int_{1 / 130}^{1 / 120} f(y) d y \\
& =\int_{-\infty}^{1 / 120} f(y) d y-\int_{-\infty}^{1 / 130} f(y) d y \\
& =F(1 / 120)-F(1 / 130) \\
& =60(1 / 120)-60(1 / 130) \\
& =1 / 26 \approx 0.0384
\end{aligned}
$$

Functions
A special case: the exponential

$$
\begin{aligned}
F(x) & =P(X \leq x)=\int_{-\infty}^{x} f(x) d x \\
& =\int_{-\infty}^{0} 0 d x+\int_{0}^{x} \frac{1}{2} e^{-t / 2} d t \\
& =-\left.e^{-t / 2}\right|_{0} ^{x}=-e^{-x / 2}-\left(-e^{-0 / 2}\right) \\
& =1-e^{-x / 2}
\end{aligned}
$$

## Hence:

Introduction to
Continuous
Random Variables
Probability Density Functions

$$
F(x)= \begin{cases}1-e^{-x / 2} & x \geq 0 \\ 0 & \text { otherwise }\end{cases}
$$

A special case: the exponential
In general, an $\operatorname{Exp}(\alpha)$ random variable has cdf:

$$
F(x)= \begin{cases}1-e^{-x / \alpha} & x \geq 0 \\ 0 & \text { otherwise }\end{cases}
$$

## Uses of the $\operatorname{Exp}(\alpha)$ random variable

- An $\operatorname{Exp}(\alpha)$ random variable measures the waiting time until a specific event that has an equal chance of happening at any point in time.
- Examples:
- Time between your arrival at a bus stop and the

A special case: the exponential distribution moment the bus comes.

- Time until the next person walks inside the library.
- Time until the next car accident on a stretch of highway.
