## Outline

Joint Distributions
Marginal Distributions
Conditional Distributions Independence

## The Continuous Case

## Example: bearings

- Consider multiple random variables at the same time.
- Suppose you're manufacturing ring bearings (nominal
inner diameter 1.00 in) on rods (nominal diameter 0.99
- Suppose you're manufacturing ring bearings (nominal
inner diameter 1.00 in) on rods (nominal diameter 0.99 in). Let:
- $X=$ the inside diameter of the next ring bearing
- $Y=$ rod diameter where the ring is located
- We might want to know probabilities like

$$
P(X<Y)
$$

since if $X<Y$, the assembly cannot be made.

## Example: bearings

- A joint probability function for discrete random variables $X$ and $Y$ is a nonnegative function $f(x, y)$ such that:

$$
f(x, y)=P(X=x \text { and } Y=y)
$$

as a distribution, $f \geq 0$ and:

$$
\sum_{x, y} f(x, y)=1
$$

- For the discrete case, it is useful to give $f(x, y)$ in a table.
- Example: suppose:
- $X=$ torque required to loosen bolt $\# 3$ in the next apparatus.
- $Y=$ torque for bolt \#4.
where all torques are rounded to the nearest integer.

## Example: torque (blank entries are 0 )

Joint Distributions and Independence (Ch. 5.4)

## Will Landau

$f(x, y)$ for the Bolt Torque Problem

| $y \backslash$ | $x$ | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 20 |  |  |  |  |  |  |  |  | $2 / 34$ | $2 / 34$ | $1 / 34$ |
| 19 |  |  |  |  |  |  |  | $2 / 34$ |  |  |  |
| 18 |  |  |  | $1 / 34$ | $1 / 34$ |  |  | $1 / 34$ | $1 / 34$ | $1 / 34$ |  |
| 17 |  |  |  |  | $2 / 34$ | $1 / 34$ | $1 / 34$ | $2 / 34$ |  |  |  |
| 16 |  |  |  | $1 / 34$ | $2 / 34$ | $2 / 34$ |  |  | $2 / 34$ |  |  |
| 15 | $1 / 34$ | $1 / 34$ |  |  | $3 / 34$ |  |  |  |  |  |  |
| 14 |  |  |  |  | $1 / 34$ |  |  | $2 / 34$ |  |  |  |
| 13 |  |  |  |  | $1 / 34$ |  |  |  |  |  |  |

- $P(X=18$ and $Y=17)=\frac{2}{34}$
- $P(X=14$ and $Y=19)=0$

## Your turn: torque

## Will Landau

$f(x, y)$ for the Bolt Torque Problem

| $y \backslash$ | $x$ | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |

## Combinations of bolt 3

and bolt 4 torques with $|x-y| \leq 1$

## Answers: torque

The Discrete Case
Joint Distributions
Marginal Distributions

$$
\begin{aligned}
P(X & \geq Y)=\sum_{x \geq y} f(x, y) \\
& =f(13,13)+f(14,13)+f(14,14)+\cdots+f(20,20)
\end{aligned}
$$

Dropping all the $f(x, y)$ values that equal 0 :

$$
\begin{aligned}
& =f(15,14)+f(15,15)+f(15,16)+f(16,16) \\
& +f(16,17)+f(17,17)+f(17,18)+f(18,17) \\
& +f(18,18)+f(19,18)+f(19,20)+f(20,20) \\
& =\frac{18}{34}
\end{aligned}
$$

## Marginal distributions

- The marginal distributions of $X$ and $Y$, which have joint pmf $f(x, y)$, are:

$$
\begin{aligned}
f_{X}(x) & =\sum_{y} f(x, y) \\
f_{Y}(y) & =\sum_{x} f(x, y)
\end{aligned}
$$

- $f_{X}(x)$ is just the ordinary, univariate pmf of $X$.

## Your turn: torque

## Will Landau

- Calculate the marginal pmfs of $X$ and $Y$
$f(x, y)$ for the Bolt Torque Problem

| $y \backslash$ | $x$ | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 20 |  |  |  |  |  |  |  |  | $2 / 34$ | $2 / 34$ | $1 / 34$ |
| 19 |  |  |  |  |  |  |  | $2 / 34$ |  |  |  |
| 18 |  |  |  | $1 / 34$ | $1 / 34$ |  |  | $1 / 34$ | $1 / 34$ | $1 / 34$ |  |

| $f_{X}(x)$ | $1 / 34$ | $1 / 34$ | $1 / 34$ | $2 / 34$ | $9 / 34$ | $3 / 34$ | $4 / 34$ | $7 / 34$ | $5 / 34$ | $1 / 34$ |  |  |

Will Landau

The Discrete Case
Joint Distributions
Marginal Distributions
Conditional
Distributions
Independence
The Continuous

- For example, $f_{Y \mid X=18}(20)=\frac{2 / 34}{7 / 34}=2 / 7$. That makes sense because:
- Since $f_{X}(18)=7 / 34$, we expect roughly 7 out of every 34 cases to have $X=18$.
- Since $f_{X, Y}(18,20)=2 / 34$, we expect roughly 2 of those 7 cases to also have $Y=20$.

## Example: torque

## Will Landau

| $y$ | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{X, Y}(18, y)$ | $2 / 34$ | 0 | $1 / 34$ | $2 / 34$ | 0 | 0 | $2 / 34$ | 0 |
| $f_{Y \mid X=18}(y)$ | $2 / 7$ | 0 | $1 / 7$ | $2 / 7$ | 0 | 0 | $2 / 7$ | 0 |

- $\sum_{y=13}^{20} f_{X, Y}(18, y)=f_{X}(18)=7 / 34$
- $\sum_{y=13}^{20} f_{Y \mid X=18}(y)=1$
- The conditional distribution, $f_{Y \mid X=18}$ is the renormalized column of the joint distribution corresponding to $X=18$.

## Your turn: torque

| 1 | .08 | .08 | .04 | .2 |
|  | .4 | .4 | .2 |  |

Joint Distributions and Independence (Ch. 5.4)

## Will Landau

The Discrete Case
Joint Distributions
Marginal Distributions
Conditional
Distributions
Independence
The Continuous

- Among just the cases when $X=1$ :
- $Y=3$ every 16 out of $(16+16+8)=40$ times: i.e., with probability $\frac{16}{40}=0.4$
- Same with $Y=2$
- $Y=1$ every 8 out of $(16+16+8)=40$ times: i.e., with probability 0.2
- So pmf of $Y$ given $X=1$ is the same as the marginal pmf of $Y$.

## Independence

- Discrete random variables $X$ and $Y$ are independent (written $X \Perp Y$ ) if for all $x$ and $y$,

$$
P(Y=y \mid X=x)=P(Y=y)
$$

where | means "given".

- If $X \Perp Y$, then:

$$
\begin{aligned}
P(Y=y \text { and } X=x) & =P(X=x) \cdot P(Y=y) \\
f(x, y) & =f_{X}(x) \cdot f_{Y}(y)
\end{aligned}
$$

- If $X$ and $Y$ are not only independent but also have the same marginal distribution, then they are independent and identically distributed, abbreviated iid.

Checking for measurement bias: P (measured excess time $>$ actual excess time)

$$
\begin{aligned}
P(R>S) & =\iint_{r>s} f(s, r) d s d r \\
& =\int_{0}^{\infty} \int_{s}^{\infty} f(s, r) d r d s \\
& =\int_{0}^{\infty} \frac{1}{16.5} e^{-s / 16.5}\left\{\int_{s}^{\infty} \frac{1}{\sqrt{2 \pi(0.25}} e^{-(r-s)^{2} / 2(0.25)} d r\right\} d s \\
& =\int_{0}^{\infty} \frac{1}{16.5} e^{-s / 16.5}\left\{\frac{1}{2}\right\} d s \\
& =\frac{1}{2}
\end{aligned}
$$

## Continuous marginal and conditional distributions

- For continuous random variables $X$ and $Y$, the marginal distribution of $X$ is:

$$
f_{X}(x)=\int_{-\infty}^{\infty} f(x, y) d y
$$

- The conditional distribution of $Y$ given $X=x$ is:

$$
f_{Y \mid X=x}(y)=\frac{f(x, y)}{f_{X}(x)}
$$
