## Expectations and variances of linear combinations

The Central Limit Theorem

## Functions of several random variables

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function form:

$$
U=g(X, Y, \ldots, Z)
$$

where $X, Y, \ldots, Z$ are random variables.

- $U$ is itself a random variable.

Expectations and variances of linear

The Central Limit Theorem

- We often consider functions of random variables of the

## Example: connecting steel parts

- Suppose that a steel plate with nominal thickness .15 in. is to rest in a groove of nominal width . 155 in ., machined on the surface of a steel block.

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function
Relative Frequency Distribution of Slot Widths

| Slot Width (in.) | Relative Frequency |
| :---: | :---: |
| .153 | .2 |
| .154 | .2 |
| .155 | .4 |
| .156 | .2 |

Expectations and variances of linear combinations

The Central Limit Theorem

- $X=$ plate thickness
- $Y=$ slot width
- $U=Y-X$, the "wiggle room" of the plate

## The distributions of $X, Y$, and $U$

Functions of
Several Random Variables (Ch. 5.5)

## Will Landau

Functions of
Several Random
Variables
Approximating the Mean and Variance

The Central Limit Theorem
of a Function
Expectations and variances of linear combinations

- Determining the distribution of $U$ is difficult in the continuous case.

The Probability Function for the

Clearance $U=Y-X$

| $u$ | $f(u)$ |
| :---: | :--- |
| .003 | .06 |
| .004 | $.12=.06+.06$ |
| .005 | $.26=.08+.06+.12$ |
| .006 | $.26=.08+.12+.06$ |
| .007 | $.22=.16+.06$ |
| .008 | .08 |

Marginal and Joint Probabilities for $X$ and $Y$

| $y$ | $x$ | .148 | .149 | .150 | $f_{Y}(y)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| .156 | .08 | .06 | .06 | .2 |  |
| .155 | .16 | .12 | .12 | .4 |  |
| .154 | .08 | .06 | .06 | .2 |  |
| .153 | .08 | .06 | .06 | .2 |  |
| $f_{X}(x)$ | .4 | .3 | .3 |  |  |

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function

Approximating the Mean and Variance of a Function
Expectations and variances of linear combinations

The Central Limit Theorem

## Expectations and variances of linear combinations

The Central Limit Theorem

Approximating $E(U)$ and $\operatorname{Var}(U)$ when determining $f_{U}(u)$ is too hard

- If $X, Y, \ldots, Z$ are independent, $g$ is well-behaved, and the variances $\operatorname{Var}(X), \operatorname{Var}(Y), \ldots, \operatorname{Var}(Z)$ are small enough, then $U=g(X, Y, \ldots Z)$ has:

$$
\begin{aligned}
E(U) & \approx g(E(X), E(Y), \ldots, E(Z)) \\
\operatorname{Var}(U) & \approx\left(\frac{\partial g}{\partial x}\right)^{2} \operatorname{Var}(X)+\left(\frac{\partial g}{\partial y}\right)^{2} \operatorname{Var}(Y)+\cdots+\left(\frac{\partial g}{\partial z}\right)^{2} \operatorname{Var}(Z)
\end{aligned}
$$

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit Theorem

- These formulas are often called the propagation of error formulas.

## Example: an electric circuit

## Resistor 2

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit

- $R$ is the total resistance of the circuit.
- $R_{1}, R_{2}$, and $R_{3}$ are the resistances of resistors 1,2 , and 3 , respectively.
- $E\left(R_{i}\right)=100, \operatorname{Var}\left(R_{i}\right)=2, i=1,2,3$.

$$
R=g\left(R_{1}, R_{2}, R_{3}\right)=R_{1}+\frac{R_{2} R_{3}}{R_{2}+R_{3}}
$$

## Example: an electric circuit

## Will Landau

$$
\begin{aligned}
E(R) & \approx g(100,100,100)=100+\frac{(100)(100)}{100+100}=150 \Omega \\
\frac{\partial g}{\partial r_{1}} & =1 \\
\frac{\partial g}{\partial r_{2}} & =\frac{\left(r_{2}+r_{3}\right) r_{3}-r_{2} r_{3}}{\left(r_{2}+r_{3}\right)^{2}}=\frac{r_{3}^{2}}{\left(r_{2}+r_{3}\right)^{2}} \\
\frac{\partial g}{\partial r_{3}} & =\frac{\left(r_{2}+r_{3}\right) r_{2}-r_{2} r_{3}}{\left(r_{2}+r_{3}\right)^{2}}=\frac{r_{2}^{2}}{\left(r_{2}+r_{3}\right)^{2}} \\
\operatorname{Var}(\mathrm{R}) & \approx(1)^{2}(2)^{2}+\left(\frac{(100)^{2}}{(100+100)^{2}}\right)^{2}(2)^{2}+\left(\frac{(100)^{2}}{(100+100)^{2}}\right)^{2}(2)^{2} \\
& =4.5
\end{aligned}
$$

$\mathrm{SD}(R) \sqrt{4.5} \approx 2.12 \Omega$

## Outline

Functions of Several Random Variables (Ch. 5.5)

Will Landau

Functions of
Several Random

## Functions of Several Random Variables

Approximating the Mean and Variance of a Function Expectations and variances of linear combinations

The Central Limit Theorem

## Expectations and variances of linear combinations

## The Central Limit Theorem

## Expectations and variances of linear combinations

- $X_{1}, X_{2}, \ldots, X_{n}$ are independent random variables and

$$
Y=a_{0}+a_{1} X_{1}+a_{2} X_{2}+\cdots+a_{n} X_{n}
$$

then:

$$
\begin{aligned}
E(Y) & =E\left(a_{0}+a_{1} X_{1}+a_{2} X_{2}+\cdots+a_{n} X_{n}\right) \\
& =a_{0}+a_{1} E\left(X_{1}\right)+a_{2} E\left(X_{2}\right)+\cdots+a_{n} E\left(X_{n}\right) \\
\operatorname{Var}(Y) & =\operatorname{Var}\left(a_{0}+a_{1} X_{1}+a_{2} X_{2}+\cdots+a_{n} X_{n}\right) \\
& =a_{1}^{2} \cdot \operatorname{Var}\left(X_{1}\right)+a_{2}^{2} \cdot \operatorname{Var}\left(X_{2}\right)+\cdots+a_{n}^{2} \cdot \operatorname{Var}\left(X_{n}\right)
\end{aligned}
$$

## Your turn: linear combinations

- Say we have two independent random variables $X$ and $Y$ with $E(X)=3.3, \operatorname{Var}(X)=1.91, E(Y)=25$, and $\operatorname{Var}(Y)=65$.
- Find:

Functions of
Several Random Variables

Approximating the
Mean and Variance
of a Function
Expectations and variances of linear combinations

The Central Limit Theorem

## Answers: linear combinations

## Will Landau

$$
\begin{aligned}
E(3+2 X-3 Y) & =3+2 E(X)-3 E(Y) \\
& =3+2 \cdot 3.3-3 \cdot 25 \\
& =-65.4
\end{aligned}
$$

$$
\begin{aligned}
E(-4 X+3 Y) & =-4 E(X)+3 E(Y) \\
& =-4 \cdot 3.3+3 \cdot 25 \\
& =61.8
\end{aligned}
$$

$$
E(-4 X-6 Y)=-4 \cdot E(X)-6 \cdot E(Y)
$$

$$
=-4 \cdot 3.3-6 \cdot 25
$$

$$
=-163.2
$$

## Answers: linear combinations

## Will Landau

$$
\begin{aligned}
\operatorname{Var}(3+2 X-3 Y) & =2^{2} \cdot \operatorname{Var}(X)+(-3)^{2} \operatorname{Var}(Y) \\
& =4 \cdot 1.91+9 \cdot 65 \\
& =592.64 \\
\operatorname{Var}(2 X-5 Y) & =2^{2} \cdot \operatorname{Var}(X)+(-5)^{2} \operatorname{Var}(Y) \\
& =4 \cdot 1.91+25 \cdot 65 \\
& =1632.64
\end{aligned}
$$

$$
\begin{aligned}
\operatorname{Var}(-4 X-6 Y) & =(-4)^{2} \cdot \operatorname{Var}(X)+(-6)^{2} \operatorname{Var}(Y) \\
& =16 \cdot 1.91+36 \cdot 65 \\
& =2370.56
\end{aligned}
$$

## Your turn: more linear combinations

Functions of
Several Random Variables

- Say $X \sim \operatorname{Binomial}(n=10, p=0.5)$ and $Y \sim$ Poisson $(\lambda=3)$.
- Calculate:

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit

$$
\begin{array}{r}
E(5+2 X-7 Y) \\
\operatorname{Var}(5+2 X-7 Y)
\end{array}
$$

## Answer: more linear combinations

- First, note that:

## Will Landau

$$
\begin{aligned}
E(X) & =n p=10 \cdot 0.5=5 \\
E(Y) & =\lambda=3 \\
\operatorname{Var}(X) & =n p(1-p)=10(0.5)(1-0.5)=2.5 \\
\operatorname{Var}(Y) & =\lambda=3
\end{aligned}
$$

Now, we can calculate:

$$
\begin{aligned}
E(5+2 X-7 Y) & =5+2 E(X)-7 E(Y) \\
& =5+2 \cdot 5-7 \cdot 3 \\
& =-6
\end{aligned}
$$

$$
\begin{aligned}
\operatorname{Var}(5+2 X-7 Y) & =2^{2} \cdot \operatorname{Var}(X)+(-7)^{2} \cdot \operatorname{Var}(Y) \\
& =4 \cdot 2.5+49 \cdot 3 \\
& =157
\end{aligned}
$$

## iid random variables.

- Identically Distributed: Random variables $X_{1}, X_{2}, \ldots, X_{n}$ are identically distributed if they have the same probability distribution.
- "iid": Random variables $X_{1}, X_{2}, \ldots, X_{n}$ are iid if they

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations are Independent and Identically Distributed.

## Your turn: averages of iid random variables

- $X_{1}, X_{2}, \ldots, X_{n}$ are iid with expectation $\mu$ and variance $\sigma^{2}$.
- Derive:

## Will Landau

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function

$$
\begin{aligned}
& E(\bar{X}) \\
& \operatorname{Var}(\bar{X})
\end{aligned}
$$

where:

$$
\bar{X}=\frac{X_{1}+X_{2}+\cdots+X_{n}}{n}
$$

the mean of the $X_{i}$ 's.

## Answers: averages of iid random variables

Functions of
Several Random

$$
\begin{aligned}
E(\bar{X}) & =E\left(\frac{X_{1}+X_{2}+\cdots+X_{n}}{n}\right) \\
& =\frac{1}{n} E\left(X_{1}\right)+\frac{1}{n} E\left(X_{2}\right)+\cdots+\frac{1}{n} E\left(X_{n}\right) \\
& =\underbrace{\frac{1}{n} \mu+\frac{1}{n} \mu+\cdots+\frac{1}{n} \mu}_{n \text { times }} \\
& =n \cdot \frac{1}{n} \mu \\
& =\mu
\end{aligned}
$$

- Remember $E(\bar{X})=\mu$ : it's an important result.

## Answers: averages of iid random variables

## Will Landau

$$
\begin{aligned}
\operatorname{Var}(\bar{X}) & =\operatorname{Var}\left(\frac{X_{1}+X_{2}+\cdots+X_{n}}{n}\right) \\
& =\underbrace{\left(\frac{1}{n}\right)^{2} \operatorname{Var}\left(X_{1}\right)+\left(\frac{1}{n}\right)^{2} \operatorname{Var}\left(X_{2}\right)+\cdots+\left(\frac{1}{n}\right)^{2} \cdot \operatorname{Var}\left(X_{n}\right)}_{n \text { times }} \\
& =\underbrace{\frac{1}{n^{2}} \sigma^{2}+\frac{1}{n^{2}} \sigma^{2}+\cdots+\frac{1}{n^{2}} \sigma^{2}} \\
& =n \cdot \frac{1}{n^{2}} \sigma^{2} \\
& =\frac{\sigma^{2}}{n}
\end{aligned}
$$

- Remember $\operatorname{Var}(\bar{X})=\frac{\sigma^{2}}{n}:$ it's another important result.

## Example: length of seeds

- A botanist has collected a sample of 10 seeds and measures the length of each.
- The seed lengths $X_{1}, X_{2}, \ldots, X_{10}$ are supposed to be iid with mean $\mu=5 \mathrm{~mm}$ and variance $\sigma^{2}=2 \mathrm{~mm}^{2}$.

$$
\begin{aligned}
& E(\bar{X})=\mu=5 \\
& \operatorname{Var}(\bar{X})=\sigma^{2} / n=2 / 10=0.2
\end{aligned}
$$

Functions of Several Random Variables

Approximating the Mean and Variance of a Function

Approximating the Mean and Variance of a Function
Expectations and variances of linear combinations

The Central Limit Theorem

## Expectations and variances of linear combinations

The Central Limit Theorem

## The Central Limit Theorem

Functions of

Functions of
Several Random Variables

- If $X_{1}, X_{2}, \ldots, X_{n}$ are any iid random variables with mean $\mu$ and variance $\sigma^{2}<\infty$, and if $n \geq 25$,

$$
\bar{X} \approx \operatorname{Normal}\left(\mu, \frac{\sigma^{2}}{n}\right)
$$

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit Theorem

- The Central Limit Theorem (CLT) one of the most important and useful results in statistics.

## Example: tool serial numbers

- $W_{1}=$ last digit of the serial number observed next

## Will Landau

 Monday at 9 AM- $W_{2}$ = last digit of the serial number the Monday after at 9 AM
- $W_{1}$ and $W_{2}$ are independent with pmf:

$$
f(w)= \begin{cases}0.1 & w=0,1,2, \ldots, 9 \\ 0 & \text { otherwise }\end{cases}
$$

Functions of
Several Random Variables

Approximating the
Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit Theorem

- $\bar{W}=\frac{1}{2}\left(W_{1}+W_{2}\right)$ has the pmf:

The Probability Function for $\bar{W}$ for $n=2$

| $\bar{w}$ | $f(\bar{w})$ | $\bar{w}$ | $f(\bar{w})$ | $\bar{w}$ | $f(\bar{w})$ | $\bar{w}$ | $f(\bar{w})$ | $\bar{w}$ | $f(\bar{w})$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.0 | . 01 | 2.0 | . 05 | 4.0 | . 09 | 6.0 | . 07 | 8.0 | . 03 |
| 0.5 | . 02 | 2.5 | . 06 | 4.5 | . 10 | 6.5 | . 06 | 8.5 | . 02 |
| 1.0 | . 03 | 3.0 | . 07 | 5.0 | . 09 | 7.0 | . 05 | 9.0 | . 01 |
| 1.5 | . 04 | 3.5 | . 08 | 5.5 | . 08 | 7.5 | . 04 |  |  |

## Example: tool serial numbers

- What if $\bar{W}=\frac{1}{8}\left(W_{1}+W_{2}+\cdots+W_{8}\right)$, the average of 8 days of initial serial numbers?

The Central Limit
Theorem

## Example: excess sale time

- $\bar{S}=$ sample mean excess sale time (over a 7.5 s threshold) for 100 stamp sales.
- Each individual excess sale time should have an $\operatorname{Exp}(\alpha=16.5$ s) distribution. That means:
- $E(\bar{S})=\alpha=16.5 \mathrm{~s}$
- $S D(\bar{S})=\sqrt{\operatorname{Var}(\bar{S})}=\sqrt{\frac{\alpha^{2}}{100}}=1.65 \mathrm{~s}$
- By the Central Limit Theorem, $\bar{S} \approx N\left(16.5,1.65^{2}\right)$
- We want to approximate $P(\bar{S}>17)$.

## Will Landau

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function

Expectations and

The approximate probability
distribution of $\bar{S}$ is normal
with mean 16.5 and standard

## Example: excess sale time

Functions of
Several Random Variables (Ch. 5.5)

## Will Landau

Functions of
Several Random Variables

$$
\begin{aligned}
P(\bar{S}>17) & =P\left(\frac{\bar{S}-16.5}{1.65}>\frac{17-16.5}{1.65}\right) \\
& \approx P(Z>0.303) \quad(Z \sim N(0,1)) \\
& =1-P(Z \leq 0.303) \\
& =1-\Phi(0.303) \\
& =1-0.62 \quad \text { from the standard normal table } \\
& =0.38
\end{aligned}
$$

## Example: net weight of baby food jars

- Individual jar weights are iid with unknown mean $\mu$ and standard deviation $\sigma=1.6 \mathrm{~g}$
- $\bar{V}=$ sample mean weight of n jars $\approx N\left(\mu, \frac{1.6^{2}}{n}\right)$.
- We want to find $\mu$. One way to hone in on $\mu$ is to find $n$ such that:

$$
P(\mu-0.3<\bar{V}<\mu+0.3)=0.8
$$

That way, our measured value of $\bar{V}$ is likely to be close to $\mu$.

## Example: net weight of baby food jars

## Will Landau

$$
\begin{aligned}
0.8 & =P(\mu-0.3<\bar{V}<\mu+0.3) \\
& =P\left(\frac{-0.3}{1.6 / \sqrt{n}}<\frac{\bar{V}-\mu}{1.6 / \sqrt{n}}<\frac{0.3}{1.6 / \sqrt{n}}\right) \\
& \approx P(-0.19 \sqrt{n}<Z<0.19 \sqrt{n}) \quad(\text { by CLT }) \\
& =1-2 \Phi(-0.19 \sqrt{n}) \quad(\text { look at the } \mathrm{N}(0,1) \mathrm{pdf}) \\
\Phi^{-1}(0.1) & =-0.19 \sqrt{n} \\
n & =\frac{\Phi^{-1}(0.1)^{2}}{(-0.19)^{2}} \\
& =\frac{(-1.28)^{2}}{(-0.19)^{2}} \quad \text { (standard normal table) } \\
& =46.10
\end{aligned}
$$

- Hence, we'll need a sample size of $n=47$.

## Example: cars

- Suppose a bunch of cars pass through certain stretch of
road. Whenever a car comes, you look at your watch and record the time.
- Let $X_{i}$ be the time (in hours) between when the $i$ 'th car

Functions of
Several Random Variables

Approximating the Mean and Variance of a Function comes and the $(i+1)$ 'th car comes, $i=1, \ldots, 44$. Suppose you know:

Expectations and variances of linear combinations

The Central Limit Theorem

$$
X_{1}, X_{2}, \ldots, X_{44} \sim \text { iid } f(x)=e^{-x} \quad x \geq 0
$$

- Find the probability that the average time gap between cars exceeds 1.05 hours.

## Example: cars

Functions of
Several Random
Variables (Ch. 5.5)

## Will Landau

$$
\begin{aligned}
\mu & =E\left(X_{1}\right) \\
& =\int_{-\infty}^{\infty} x f(x) d x \\
& =\int_{0}^{\infty} x e^{-x} d x \\
& =-\left.e^{-x}(x+1)\right|_{0} ^{\infty} \quad \text { integration by parts } \\
& =1
\end{aligned}
$$

## Functions of

Several Random
Variables

Approximating the Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit Theorem

## Example: cars

Functions of

## Will Landau

Functions of

$$
\begin{aligned}
E\left(X_{1}^{2}\right) & =\int_{-\infty}^{\infty} x^{2} f(x) d x \\
& =\int_{0}^{\infty} x^{2} e^{-x} d x \\
& =-\left.e^{-x}\left(x^{2}+2 x+2\right)\right|_{0} ^{\infty} \quad \text { integration by parts } \\
& =2 \\
\sigma^{2} & =\operatorname{Var}\left(X_{1}\right) \\
& =E\left(X_{1}^{2}\right)-E^{2}\left(X_{1}\right) \\
& =2-1^{2} \\
& =1
\end{aligned}
$$

## Example: cars

Functions of

## Will Landau

## Functions of

Several Random Variables

Approximating the

$$
\begin{aligned}
\bar{X} & \sim \text { approx. } N\left(\mu, \sigma^{2} / n\right) \\
& =N(1,1 / 44)
\end{aligned}
$$

Thus:

Mean and Variance of a Function

Expectations and variances of linear combinations

The Central Limit
Theorem
$\frac{\bar{X}-1}{\sqrt{1 / 44}} \sim N(0,1)$

## Example: cars

Functions of
Several Random Variables (Ch. 5.5)

## Will Landau

Functions of
Several Random Variables

Approximating the Mean and Variance

$$
\begin{aligned}
P(\bar{X}>1.05) & =P\left(\frac{\bar{X}-1}{\sqrt{1 / 44}}>\frac{1.05-1}{\sqrt{1 / 44}}\right) \\
& =P\left(\frac{\bar{X}-1}{\sqrt{1 / 44}}>0.332\right) \\
& \approx P(Z>0.332) \\
& =1-P(Z \leq 0.332) \\
& =1-\Phi(0.332) \\
& =1-0.630=0.370
\end{aligned}
$$
